

INSTALLATION_FILES File

A List of the Files Involved in the Installation Process

Files Downloaded with the Source Code & 'Boilerplate' Files

These files are generated by the GNU Autotools process and appear with the source code files when they are extracted :

- compile,
- config.guess,
- config.h.in.
- config.sub,
- configure,
- configure.ac,
- depcomp,
- install-sh,
- Makefile.am (a file this of this name also appears in subdirectories),
- Makefile.in (a file this of this name also appears in subdirectories),
- missing,
- mkinstalldirs.

In addition to the above files required for the Raquel DBMS, the Raquel GUI/Teaching Tool has the following files :

- libtcl.so (a softlink pointing to the Tcl runtime file),
- libtk.so (a softlink pointing to the Tk runtime file).

Files Resulting From the Installation Process

These files are generated during the compilation and installation process :

- config.h,
- config.status (this is created & used by the 'configure' script file),
- config.cache,
- config.log,
- Makefile (a file this of this name also appears in subdirectories),
- stamp-h1.

These files are generated in the case of both the Raquel DBMS and the Raquel GUI/Teaching Tool.

All of these files can be ignored by the user.

There can be slight variations in these lists of (ignorable) files, depending on the specific installation.
